CIGS 0279: scalar multiplier sweep for C60

20% Hadamard sampling; NPL-default noise; one fixed measurement; 512 PDHG iterations

We predicted the positive C60 parameter map once, then reconstructed using $\Lambda_\rho = \rho\Lambda_{\mathrm{C60}}$ for $\rho \in \{0.1, 0.2, \ldots, 10.0\}$ (100 runs). We selected $\rho^* = 1.1$ by the largest PSNR on the ground truth. This is an **oracle test-image experiment**, not an unbiased test score.

Method	PSNR (dB)	SSIM	HaarPSI	MSE
Zero-filled	26.513	0.5039	0.6453	2.232e-03
Scalar TV oracle 512	33.514	0.9173	0.8294	4.453e-04
C60 rho=1	33.422	0.9372	0.8287	4.548e-04
C60 rho=1.1	33.454	0.9357	0.8208	4.515e-04
